

Comprehensive Model Results Summary

Hedonic Price Index Analysis

Generated: 2026-02-10 15:59:22

14 Models: 7 Types $\times$ 2 Time Dimensions (Quarterly/Annual)

Quarterly Models - Cumulative Jevons Indices

Model	Final Chained Jevons Index	R ² (price-change)
Traditional Jevons	-1.4231 (-142.31%)	N/A
Levels Hedonic	-0.6759 (-67.59%)	0.1279
Levels Hedonic with Lagged Errors	-0.7226 (-72.26%)	0.0936
Price-Change Hedonic	-1.4110 (-141.10%)	0.2559
Price-Change Hedonic with Lagged B	-1.4020 (-140.20%)	0.2772
Price-Change Hedonic with OLS	-1.2952 (-129.52%)	0.4364
Levels Hedonic with Time-Dummy Va	-1.0399 (-103.99%)	0.0000

Annual Models - Cumulative Jevons Indices

All models cover 2020 to 2025 (5 periods)

Model	Final Chained Jevons Index	R ² (price-change)
Traditional Jevons	-1.2135 (-121.35%)	N/A
Levels Hedonic	-0.7387 (-73.87%)	0.1915
Levels Hedonic with Lagged Errors	-0.7325 (-73.25%)	0.1012
Price-Change Hedonic	-1.1970 (-119.70%)	0.2498
Price-Change Hedonic with Lagged B	-1.1968 (-119.68%)	0.2623
Price-Change Hedonic with OLS	-1.1371 (-113.71%)	0.4226
Levels Hedonic with Time-Dummy Va	-0.8412 (-84.12%)	0.0000

Quarterly Models - Cumulative Jevons Indices Comparison

Annual Models - Cumulative Jevons Indices Comparison

Model Descriptions

- **Traditional Jevons Index:**

Direct calculation using actual prices. No quality adjustment. Serves as baseline.

- **Basic Hedonic:**

Standard hedonic regression. Independent Lasso model for each period. Controls for product features.

- **Basic + Error Feature:**

Hedonic regression with previous period prediction error as additional feature. Captures time dependencies.

- **Delta Model (Lasso):**

Directly models log price differences between consecutive periods using Lasso. Uses OOF predictions to avoid mean-matching artifacts. Automatic feature selection.

- **Delta + Error Feature:**

Combines Delta model with error feature from previous period pair. Captures both price changes and time dependencies.

- **OLS Delta Model:**

Directly models log price differences using OLS (no regularization). All features included. Simpler interpretation.

- **Time Dummy Model:**

Pools consecutive periods data together. Adds time dummy variable. Single model predicts both periods. More efficient parameter sharing.
